Dengue Cases

It is important to note that the day-to-day numbers fluctuate, as they depend on the number of cases notified each day. Therefore, weekly numbers are a better reflection of actual trends.

Number of Reported Cases

20-Jun	21-Jun	22-Jun	23-Jun	24-Jun	25-Jun	26-Jun at 3pm
209	101	281	180	234	220	122

Number of Reported Cases by E-week (from Sun 0000hrs to Sat 2359hrs)

E-week 20 (10-16May20)	E-week 21 (17-23May20)	E-week 22 (24-30May20)	E-week 23 (31May-06Jun20)	E-week 24 (07-13Jun20)	E-week 25 (14-20Jun20)
527	620	732	868	1154	1374

Cumulative No. of cases for 2020 (First 25 E-weeks): 12363

Compiled by Communicable Diseases Division, Ministry of Health

1,374 dengue cases were reported in the week ending 20 June 2020. This is an increase of 220 cases over that in the previous week. This is the highest number of weekly dengue cases ever recorded in Singapore, since the 891 cases recorded in 2014. The cumulative number of dengue cases for this year (as of 20 June 2020) is 12,363, and the total number of cases this year is expected to exceed the 22,170 cases reported in 2013, the largest dengue outbreak in Singapore’s history. NEA strongly urges all stakeholders to take immediate action to remove any stagnant water in their homes and immediate surroundings, to destroy any mosquito breeding habitats and break the cycle of dengue transmission.

As of 22 June 2020, there are 269 active dengue clusters reported. With the concerted efforts of the community and stakeholders, the 68-case cluster at Bideford Road, and 65-case cluster at Jalan Jurong Kechil, are closed. However, there are still large clusters located at Woodleigh Close, Leicester Road, Aljunied Road, Tampines Avenue 7 and Potong Pasir Avenue 1, where intensive vector control operations are ongoing.

The traditional dengue peak season could last a few months, from June to October, thus immediate action must be taken to break disease transmission. NEA urgently seeks the community’s support to ensure that their homes (including common corridors where domestic items, such as potted plants and pails, are kept) and gardens in their compounds are free from mosquito breeding, and to use aerosol insecticide spray and mosquito repellent to protect themselves and their families.

NEA has observed a five-fold increase in the incidence of *Aedes* mosquito larvae detected in homes and common corridors in residential areas during the two-month Circuit Breaker period, compared to the two months prior. The highest percentage of mosquito breeding found in homes in the top five dengue cluster areas was 84 per cent.

Homeowners and occupants are strongly urged to do their part and pay close attention to any mosquito breeding or adult mosquitoes present in their homes, take the necessary steps to prevent or remove them, and protect themselves from mosquitoes’ bites. These include:

- 1. Regularly doing the Mozzie Wipeout and removing any stagnant water in homes;
 - Turn the pail
 - Tip the vase
 - Flip the flower pot plate
